Capacity reflects a maximum 100°F inlet temperature and 100°F ambient. Dimensions and specifications are subject to change without notice.

To obtain flow capacities at conditions other than standard (SCFM @ 100 PSIG, 100°F Inlet & 100°F Ambient), locate the multiplier at the intersection of actual operating conditions. Multiply the rated capacity of the selected dryer by the selected multiplier. The result is the corrected flow capacity of that dryer under corrected conditions.

Flow rates in excess of design due to capacity correction can result in increased pressure drop.
